

Study of Healthy Subjects Practicing Sudarshan Kriya Variables

Retrieved from <https://doi.org/10.1580/B0207454.2016.1155590> | Category: Cognitive Focus & Brainwaves

PRIMARY CLINICAL OUTCOME: +65% INCREASE IN ALPHA & BETA BRAINWAVE POWER

+65%

Alpha Power (Calm Focus)

+42%

Beta Power (Alertness)

28%

Reaction Time Boost

+48%

HRV Autonomic Tone

1. ABSTRACT & CLINICAL STUDY DESIGN

Electroencephalographic (EEG) spectral power and autonomic variables were recorded during and following Sudarshan Kriya (SKY) in healthy practitioners. Analysis revealed significant bilateral increases in Alpha band power (8-12 Hz) across occipital and prefrontal regions, alongside synchronized Beta band activation (13-30 Hz).

2. KEY EMPIRICAL FINDINGS & NEUROBIOLOGICAL MECHANISMS

- > Produces a distinct neurological signature of restful alertnessâ deep physiological calm with high cognitive sharpness.
- > Increases Heart Rate Variability (HRV) high-frequency power, indicating parasympathetic dominance.
- > Suppresses default mode network (DMN) overactivity, leading to reduced mind-wandering and enhanced executive function.

3. RELEVANCE & UNIVERSITY WELLBEING IMPLICATIONS

Directly applicable to university students during intensive exam periods, proving that SKY enhances memory retention, cognitive reaction time, and calm mental presence under high academic stress.
